0 crack.rar Wav 2.8.11 Crack.rar Music Download.txt1. Field of the Invention The present invention relates to improvements in a wireless communication system. More particularly, the present invention relates to a method and apparatus for reducing interference in a wireless communication system that multiplexes a plurality of users. 2. Description of the Related Art A wireless communication system refers to a system for relaying transmission data through a wireless medium such as a wireless channel, without using a wire such as a coaxial cable or a telephone line. Representative examples of wireless communication systems are a wireless local area network (LAN) system, a wireless metropolitan area network (MAN) system, a wireless wide area network (WWAN) system, and a wireless personal area network (PAN) system. A wireless LAN system is a wireless communication system which was designed to overcome limits associated with fixed wired communication networks. Such a

wireless LAN system employs a wireless medium such as a wireless channel to provide an access service for a mobile node that is not tied to a physical wiring medium such as a coaxial cable or a telephone line. In addition, the wireless LAN system has various other various advantages, such as a mobility feature and an easy configuration. However, the wireless LAN system is disadvantageous in that it has a relatively low communication speed and a low efficiency in spectrum utilization. The wireless MAN system is a wireless communication system which provides a wireless connection between LANs. Unlike the wireless LAN system which provides the access service for the mobile node, the wireless MAN system provides the service for stationary nodes such as a personal computer (PC) and a server. Therefore, the wireless MAN system can provide a high speed data transmission service. However, since the service coverage area of the wireless MAN system is relatively small, it is necessary to raise the frequency of the service coverage area in order to increase the total number of subscribers. The wireless WWAN system is a wireless communication system which provides the wide-area wireless communication service. The wireless WWAN system employs the satellite, which is a satellite communication technique, as a wireless medium for providing the communication service. The wireless WWAN system has a service coverage area that is larger than that of the wireless MAN system. However, as the transmission speed is generally slow and a wireless channel is a shared channel 82157476af
